

Project Design Phase
Proposed Solution Template

Date	29 September 2026
Team ID	SWTID-2026-5115
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Proposed Solution Template:

S. No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The Institution Details table contains ECE, EEE and CSE records. Different users require different access levels, but unrestricted access can expose records to unauthorized users. The project provides record-level control for Read, Create, Write and Delete operations and restricts EEE records to authorized EEE users.
2.	Idea / Solution description	Implement ServiceNow ACLs on u_institution_details. Use bb1, bb2, bb3 and bb4 for Read, Create, Write and Delete permissions. For Read access, bb1 is combined with the Branch = EEE condition, while administrators retain full access. Advanced ACL scripting supports role-based access.
3.	Novelty / Uniqueness	The solution combines role-based permissions with a field-value-based record restriction. The ACL evaluates both the user's role and the Branch value. Separate roles for Create, Write and Delete provide granular control over database operations.
4.	Social Impact / Customer Satisfaction	The solution protects student and institution information by preventing unauthorized viewing or modification. It provides clear permissions, reduces accidental changes, and increases confidence that branch-specific information is available only to authorized users.
5.	Business Model (Revenue Model)	This is primarily an internal security solution rather than a direct revenue-generating product. Its business value comes from reducing unauthorized-access risk, minimizing data errors, supporting controlled institutional access, and reducing manual permission-management effort.
6.	Scalability of the Solution	The ACL model can be extended to additional branches, departments, roles, tables and operations without changing the overall architecture. Additional roles or field conditions can be introduced as requirements grow and the same approach can secure other ServiceNow custom tables.
