### Solution Architecture:

The solution architecture for this project defines how ServiceNow Access Control Lists (ACLs), user roles, and the Branch field work together to secure records in the Institution Details table. It provides a controlled mechanism for users to read, create, update, and delete records according to their assigned permissions.

- Control access to records in the custom Institution Details table.
- Allow users with the bb1 role to read only EEE branch records.
- Provide separate permissions for Create, Write, and Delete operations using bb2, bb3, and bb4.
- Allow administrators to retain full access to all records.
